

RISKCEDE

Services

The RiskCede services project provides a platform to capture information and to perform various forms of analysis, e.g. spatial and time series analysis.

This project can be applied to various different fields, from gathering census data, performing and reporting on site inspections, monitoring security services, to using the app as a mobile censor. The platform allows for fast design of new programmes that can be deployed in a short space of time. The app not only allows for data capturing, but can also provide feedback in real time based on the input obtained.

The analysis side of the project is just as versatile: it is hosted online for real-time results and reports can be scheduled to run on a regular basis. The analysis can be used for real-time decisions or data mining and reporting or a combination thereof.
